ITALPOLLINA SPA Announces the Opening of a New State of the Art Facility for Vegetal Hydrolysates

September 25th 2015: Italtollina SpA, a leader in the production of naturally derived fertilizers and specialty plant nutrition products for use in organic and conventional agriculture, announced today the opening of its brand new facility for the production of Enzymatic Hydrolysates derived exclusively from vegetal origin.

A path started with the first pilot plant in 2011, reaches now a new goal with this project, which began in the winter of last year.

The new state of the art facility is one of the worlds largest and most advanced for the purpose of producing 100% vegetal protein hydrolysates for Industrial and Agricultural uses, establishing the highest of quality standard in this sector.

"With this project we strongly further concretize our presence in the market of biostimulants from vegetal origin" says Luca Bonini, CEO of Italtollina "For us it is a fundamental step since we begin to be recognized as a reference in the market for this specific category of vegetal hydrolysates based products. They can be proposed both as ready-to-use biostimulants or as raw material component for blenders in substitution of other products."

The new facility is based on an exclusive and cutting-edge process of Enzymatic hydrolysis of genuinely vegetal proteins that gives products rich in amino acids and peptides.

"In this new plant we have optimized timing and production efficiency by utilizing the latest technologies available today. We are all very excited with this opening, a unique happening in today market, which seems to be presently more focused on acquisitions than creation of new value through in house Know-How and organic growth. This is a new step forward, but not the last, in the development of new technologies and products safer for the environment and human health. We are very committed towards these two themes. We want to be pioneers and we are already considering new surprises in the near future", continues Luca Bonini.

With this plant Italtollina has now four different facilities worldwide, each one dedicated to a specific production (organic NPK fertilizers, micro-organisms, vegetal extracts and vegetal hydrolysates).

The new facility from Italtollina represents the largest new investment made by an Italian company in the production of biostimulants and confirms the long-term commitment to be a leader in this important sector.
